

AUTOMATION SOFTWARE

Versatile Control of Video From Anywhere at Anytime

NVerzion® CloudNine™ comes with basic automation software. This software provides a basic dub station (Cloud Record) and an elementary play list (Cloud Play). CloudNine has a fully functional VDCP interface, both serial and network. It can be easily connected to an existing automation system or expanded upon with NVerzion's NControl™ automation suite.

Cloud Play is a simple scheduler that sequentially plays a series of events from CloudNine. Specify the media you want to play, the in-point to play from, and an optional duration, and then click the play button. A drop down list displays all available media. Status windows provide clock and warning indications. 5 keys allow you to manually trigger effects. Load up to 2 schedules or implement loop mode. Cut, copy, and paste edit functionality is available.

Cloud Record is a simple, easy-to-use dub station. Frame accurately dub media from an external VTR to the CloudNine video server. The software provides a means to jog and shuttle the remote VTR. Mark an in-point, specify a duration and media ID, and click the record button. When the real time transfer is complete, you will have a new copy of the tape media on the video server.

Manual Control. The CloudNine software hosts a number of immediate manual controls that allow you to perform manual record and play out. For records, enter a name and duration, cue, and start recording. For Playout, choose the desired material, or FX, cue and play from the first frame of video or from a desired in point. 8 configurable radial buttons allow you to immediately play desired FX. Jog and shuttle buttons, as well as a slider bar, give you immediate control of the video being played. A simple manual play list, with loop mode, is also included.

NControl Lite. In addition to the free software that comes with CloudNine, NVerzion sells a wide variety of automation software solutions. NVerzion created the NControl Lite package as a gateway to a more robust automation solution. The package includes a full featured NControl play list, NGesture™ dubbing station, NPoint™ preparation and segmenting software, NBase™ MySQL database manager, NView™ database editor, EMC Router controller, and 4-port EMCNT machine control server. All of these come to you, ready to work, on a 2-RU industrial rack-mount computer. Contact NVerzion for pricing.

NVerzion's key goal is to help broadcasters manage digital workflow, which allows more efficient use of media assets across an organization.

Each system is architected and integrated with the customer in mind, so the final system delivers and provides the capabilities you need meeting your expectations in every way.
