# CPIM: Creative Protocol Interface

CPIM is a gateway that provides third-party software a direct and immediate interface with NVerzion applications such as NBase Database Manager, XPansion Archive / Storage / Distribution manager, NControl event-driven scheduler, NTime time-driven scheduler, NGest dubbing tool, and others. The CPIM application uses a file-based communication method to receive, read, interpret and execute commands from the third-party system by seamlessly and instantly determining which NVerzion application is to implement the instruction. CPIM supports two standard protocols: ATIP (Automation Traffic Interface Protocol) and BXF.

FEATURES
Simple third-party interface for a number of NVerzion applications.

BENEFITS
Enables NVerzion systems to interact with all popular broadcast traffic systems.
